

File name	Format	Row and Columns	Owner	Update Frequency	Grains
Sales transaction		8*10,589	Sales Manager	Daily	One row represents the complete transaction of each customer. Including Sales id, Branch id, Date, Product id, Customers id, Quantity, unit price, Amount, Payment method
Product		5*12	Product Manager	As Needed	One row represents Product id/name, Category, List price, Unit cost
Inventory		6*1,541	Operations	Daily	One row represents Movement, Date, Branch/Product id, Quantity moved,
Employee		7*33	Human Resources	Monthly	One row represents Employee id/name, Branch id, Role, Hire date, Daily rate, Employment Status
Customer		6*186	Marketing	Monthly	Customer id/name, Email, Tier, City, Joined date
Calendar		9*537	Operations	Monthly	One row represents the complete date, day, and year
Branches		5*6	Operations	Monthly	One row represents Branch id/name, City, Province, Date opened

Part B- 6 Business Questions

1. What product have the most sales in each branch?
2. How much sales revenue does each branch have weekly?
3. Which branch needs more inventory movement and less inventory movement?
4. Are the staff getting treated well and proper wages by their positions?
5. In what day of the week have the most customers in each branch?
6. How's the after sales? Are the customers satisfied? and what are their review/opinion of how they get treated by the staff.

Part C- Data Quality Assessment

Dimensions	Assessment
Accuracy	There are about 23 data in sales that did not match the quantity x unit cost, also for the employees some didn't have the full info,
Completeness	Not that much complete
Consistency	Some records are missing and did not match the data, some labels in inventory did not have a consistent format
Timeliness	Yes, it's enough for the current data to be use and support analysis, considering that the data started 2025 of January up until 2026 of June. Even if its not fully complete data, it could still back up the analysis
Validity	Some data are not valid considering that some of it and incomplete/wrong info on data. Example is the daily rate of the regular employee is negative
Uniqueness	Most of the data is good but I check here in sales file that there are 46 duplicated sales id.

Part D- Verdict

I think this data can be used to support these questions that I made, but considering some of the data is missing and others are duplicated it would likely be better if these files should be checked first so it cannot full support the whole analysis. And by this problem the management should double check always these data because it can cause a lot of problems in operating and managing. Example of the problem that in SalesID are duplicated, employees don't have full information and misinformation, and the sales quantity and unit cost don't match the price.

660	660
150	150
380	380

165	165
220	220
110	110
220	220
540	540

whats the formula if i need to check these if its the same

Two columns are **A** and **B**, and you want to check whether each row has the same value, use:

excel

=IF(A2=B2,"Same","Different")

File name	Format	Row and Columns	Owner	Update Frequency	Grains
Sales transaction		8*10,589	Sales Manager		
Product		5*12	Product Manager		
Inventory		6*1,541	Operations		
Employee		7*33	Human Resources		
Customer		6*186	Marketing		
Calendar		9*537	Operations		
Branches		5*6	Operations		

how frequent do you think this needs to be updated

Based on the type of data in your table, I would put these update frequencies:

File name	Update Frequency	
Sales transaction	Daily	
Product	Monthly / As needed	
Inventory	Daily	
Employee	Monthly	
Customer	Monthly	
Calendar	Yearly	
Branches	As needed / Annually
