

Part A – Source Inventory

File	Format	Business owner	Rows/ columns	Update frequency	Grain
sales_transactions.csv	CSV	Sales	10589 - 9	Daily	One row represents each sale.
customers.csv	CSV	Marketing	186 - 6	As needed	One row represents a customer's details: customer ID, name, email, tier, city, and join date.
products.xlsx	Excel	Product Manager	12 - 5	As needed	One row represents the product details: product ID, name, category, price, and unit cost.
branches.csv	CSV	Operations	6 - 5	As needed	One row represents a branch and its branch ID, location, and opened date.
employees.xlsx	Excel	Human Resources	33 - 7	As needed	One row represents an employee's details: employee ID, name, branch ID, role, hire date, daily rate, employee status
inventory_movements.csv	CSV	Supply Chain Manager	1541 - 6	Daily	One row represents movement of inventory of a product, the date, its branch, movement type, and quantity.
calendar.csv	CSV	Admin Assistant	537 - 9	Daily	One row represents a date and its specifics: date, year, quarter, month, month name, year-month, day, day-name, and day type.

who in the business would own it? [Share](#)

sales_transactions.csv
customers.csv
products.xlsx
branches.csv
employees.xlsx
Show more

Based on the **file names alone**, these would be reasonable business owners. Since your assignment says "who in the business would own it," you're identifying the **department responsible for maintaining that type of information**.

File	Likely business owner
sales_transactions.csv	Sales / Commercial department
customers.csv	Customer Management / CRM / Marketing department
products.xlsx	Product Management / Merchandising department
branches.csv	Operations / Branch Management department
employees.xlsx	Human Resources (HR)
inventory_movements.csv	Inventory / Warehouse / Operations department
calendar.csv	Finance / Business Planning / Data or IT team

what would be the update frequency for customers if their join dates are shuffled

The fact that the **join dates are shuffled** doesn't determine the update frequency. That's about the **order of the rows**, not how often the customer data would realistically be updated.

For `customers.csv`, if it contains customer records and their join dates, I'd put:

Update frequency: As needed

because a customer record would typically be added or updated when a **new customer joins or their information changes**.

So your Part A row could have:

`customers.csv` → Marketing → **As needed**

If the assignment expects a more specific frequency, **Daily** could also be reasonable if the business regularly records new customers every day. But based only on the file description, **As needed** is the safest.

Part B – Business Questions

File	Functional area	Business question
<code>sales_transactions.csv</code>	Sales and customer performance	Which branches are generating the most sales?
<code>customers.csv</code>	Sales and customer performance	Which customers are making the most purchases?
<code>products.xlsx</code>	Operations	Should we offer more products?
<code>branches.csv</code>	Operations	Which branch is performing the best?
<code>employees.xlsx</code>	Workforce	How many employees are working per branch?
<code>inventory_movements.csv</code>	Operations	Which products move in and out most often?
<code>calendar.csv</code>	Operations	How do events or holidays affect sales?

what is the functional area for these files? ex. sales and customer performance, profitability, workforce, and operations, etc. [Share](#)

sales_transactions.csv

customers.csv

products.xlsx

branches.csv

employees.xlsx

Show more ▾

Yes. If your teacher wants you to identify the **functional area** each file relates to, I would classify them like this:

File	Functional area
sales_transactions.csv	Sales and Customer Performance
customers.csv	Sales and Customer Performance
products.xlsx	Operations
branches.csv	Operations
employees.xlsx	Workforce
inventory_movements.csv	Operations
calendar.csv	Operations / Supporting Data

Part C – Data Quality Assessment

File	Column	Dimension	What I observed	Rows affected	What it would break
sales_transactions.csv	Customer ID	Completeness	Some rows have missing data	4775	The customer may not be linked to their sales
customers.csv	Email	Completeness	Some customers don't have email	11	Customer contact information incomplete
products.xlsx			I did not notice any dimension offended		
branches.csv			I did not notice any dimension offended		
employees.xlsx	Employment Status	Completeness	5 employees have no employment status	5	Employee reports may not be accurate
inventory_movements.csv	Movement Type	Consistency	Some movement types are written with different capitalization like 'Delivery' and 'delivery'	Unable to tell	Some movement type may not be counted in reports
calendar.csv			I did not notice any dimension offended

in excel, how do i select a column that has missing/blank data

If you want to find and select the blank cells in a specific Excel column, the easiest way is:

Method 1: Go To Special

1. Click the column you want to check, e.g. column `CustomerID`.
2. Press **Ctrl + G** (or **F5**).
3. Click **Special...**
4. Select **Blanks**.
5. Click **OK**.

Excel will select all the blank cells in that column.

Method 2: Filter for blanks

This is better if you want to see which records/rows are missing data:

1. Select your dataset.
2. Go to **Data** → **Filter**.
3. Click the dropdown arrow on the column you want to check.
4. Uncheck **(Select All)**.
5. Check **(Blanks)**.
6. Click **OK**.

Now Excel will show only the rows where that column is blank.

Part D – Verdict

The data can be used to answer some of the six business questions, but it has some problems that need to be considered. Some sales have missing Customer IDs so some sales may not be linked to the correct customer. Some customers also have no email, so their contact information is incomplete. Five employees have no employment status, which may make employee reports inaccurate. The inventory data also has different forms of the same movement type, such as “Delivery” and “delivery,” which may cause some movements to be counted separately. I would not publish customer, employee, or inventory numbers without a note about these problems. If a branch manager asked for the numbers, I would explain that the data can still be used, but the results may not be completely accurate.
